DAX Reference

Full list of model measures with formulas and descriptions — reference page, not for presentation.

Name	Description	Expression
revenue target	Sets revenue target as 5% above last month revenue	[last month revenue]*1.05
return rate	Calculates return rate as returned quantity divided by sold quantity	[quantity returned]/[quantity sold]
profit margin	Calculates profit margin as total profit divided by total revenue	[total profit]/[total revenue]
total profit	Calculates total profit as total revenue minus total cost	[total revenue]-[total cost]
% weekend transactions	Calculates share of weekend transactions as weekend transactions divided by total transactions	[weekend transactions]/[total transactions]
all returns	Calculates grand total returned quantity ignoring filters on Returns quantity	CALCULATE([quantity returned], ALL>Returns[quantity]))
last month profit	Calculates total profit for the previous month	CALCULATE([total profit], DATEADD('Calendar'[date],-1,MONTH))
last month returns	Calculates total returns for the previous month	CALCULATE([total returns], DATEADD('Calendar'[date],-1,MONTH))
last month revenue	Calculates total revenue for the previous month	CALCULATE([total revenue], DATEADD('Calendar'[date],-1,MONTH))
ytd revenue	Calculates year-to-date revenue based on Calendar date	CALCULATE([total revenue], DATESYTD('Calendar'[date]))
60-day rolling	Calculates rolling 60-day revenue ending at the current max Calendar date	CALCULATE([total revenue],DATESINPERIOD('Calendar'[date], MAX('Calendar'[date]),-1,MONTH))
weekend transactions	Calculates transactions for weekend dates where Calendar weekend equals "Y"	CALCULATE([total transactions], 'Calendar'[weekend]="Y")
last month transactions	Calculates total transactions for the previous month	CALCULATE([total transactions], DATEADD('Calendar'[date],-1,MONTH))
all transactions	Calculates grand total transactions ignoring filters on Transaction data quantity	CALCULATE([total transactions], ALL('Transaction data'[quantity]))
total transactions	Counts transactions by counting transaction_date rows	COUNT('Transaction data'[transaction_date])
unique products	Counts distinct product names to return the number of unique products	DISTINCTCOUNT(Products[product_name])
quantity returned	Sums total units returned from Returns quantity	SUM>Returns[quantity])
total returns	Sums total returned units from Returns quantity	SUM>Returns[quantity])
quantity sold	Sums total units sold from Transaction data quantity	SUM('Transaction data'[quantity])
total revenue	Sums total revenue from Transaction data revenue	SUM('Transaction data'[revenue])
total cost	Calculates total cost as sum of quantity multiplied by related product cost	SUMX('Transaction data','Transaction data'[quantity] * RELATED(Products[product_cos
